What is the Learning Problem?

Concept 1 (Mitchell (1997))

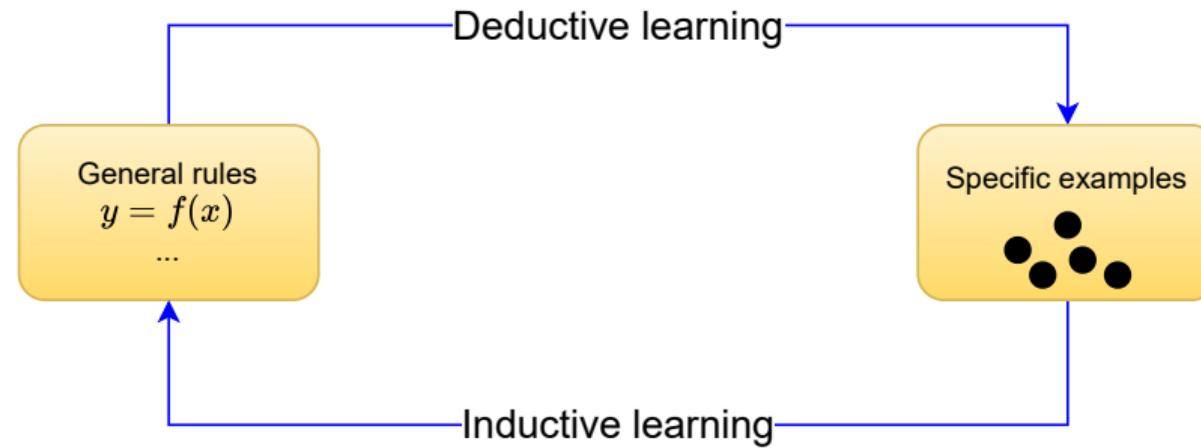

Learning \equiv Improving with experience at some task

- Improve over task T ,
- with respect to performance measure P ,
- based on experience E .

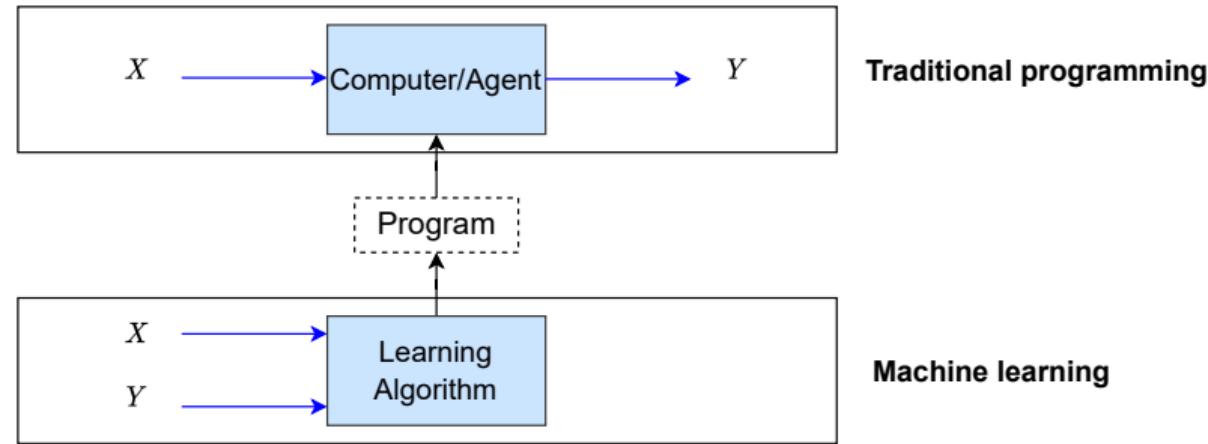

Inductive Learning

Machine Learning vs. Traditional Programming

Machine Learning vs. Agents

Interpretable Machine Learning - Explainable Artificial Intelligence

- **Explainable** could mean **interpretable**
- **Abstraction:** how much of an explanation do we need?
- The **Explainable AI (XAI)** program aims to create a suite of machine learning techniques that:
 - Produce more explainable models, while maintaining a high level of learning performance (prediction accuracy)
 - Enable human users to understand, appropriately trust, and effectively manage the emerging generation of artificially intelligent partners.

The Explainable Artificial Intelligence (cont.)

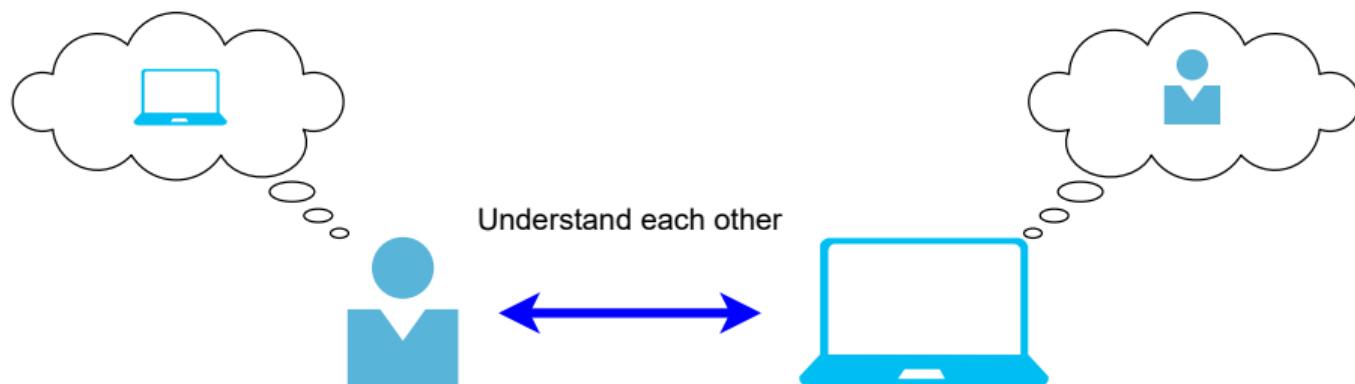

Human vs. Model

The challenge is people don't understand the system and the system doesn't understand the people.

- We need models for the system to use to understand and explain things to the human.
- We also need models in the human's head about what the system does.

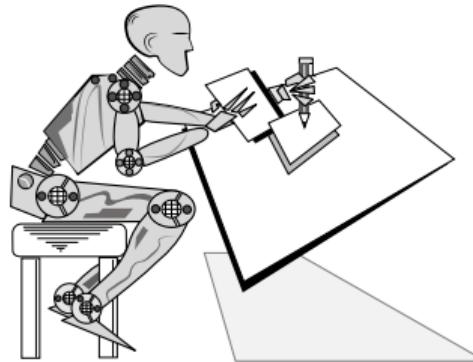

Learning Agent

Agents Need Learning

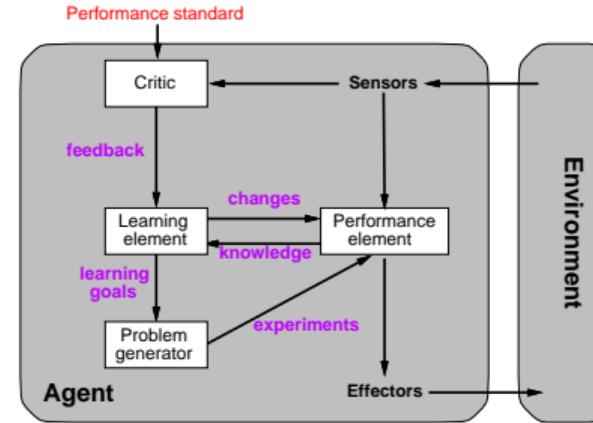

- Learning is essential for unknown environments, i.e., when designer lacks omniscience
- Learning is useful as a system construction method, i.e., expose the agent to reality rather than trying to write it down
- Learning modifies the agent's decision mechanisms to improve performance

Forms of Learning

Any component of an agent can be improved by learning from data. The improvements, and the techniques used to make them, depend on four major factors:

- Which *component* is to be improved.
- What *prior knowledge* the agent already has.
- What *representation* is used for the data and the component.
- What *feedback* is available to learn from.

Components to be learned

The components of these agents include:

1. A direct mapping from conditions on the current state to actions.
2. A means to infer relevant properties of the world from the percept sequence.
3. Information about the way the world evolves and about the results of possible actions the agent can take.
4. Utility information indicating the desirability of world states.
5. Action-value information indicating the desirability of actions.
6. Goals that describe classes of states whose achievement maximizes the agent's utility.

Each of these components can be learned.

Representation and prior knowledge

Machine Learning

Machine Learning

Interpretable Machine Learning

Learning Agent

Data

Exploration

Type of Learnings

Successes of Machine Learning

Vision

Language

Games

Robotics

Other

- Representations can be

- Functions with inputs, a vector of attribute values, and outputs, either a continuous numerical value or a discrete value
- Functions and prior knowledge composed of first-order logic sentences
- Bayesian networks

Feedback to learn from

There are three *types of feedback* that determine the three main types of learning:

- In **unsupervised learning** the agent learns patterns in the input even though no explicit feedback is supplied.
- In **reinforcement learning** the agent learns from a series of reinforcements—rewards or punishments.
- In **supervised learning** the agent observes some example input–output pairs and learns a function that maps from input to output.
 - In **semi-supervised learning** we are given a few labeled examples and must make what we can of a large collection of unlabeled examples.

Machine Learning Workflow (cont.)

1. Collect available data.
2. Clean and transform that data. If you're collecting data that is missing values, then you need to clean and transform that data until it's in the form machine learning requires.
3. Explore and visualize the data to make sure it is encoding what you expect it to encode. Build a model on training data.
4. Evaluate the model test data.
5. Deploy the model on un-seen data.
6. Monitor the model

Data

Types of Data

- **Record**

- Relational records
- Data matrix: numerical matrix
- Document data: text documents
- Transaction data

- **Graph and network**

- World Wide Web
- Social or information networks
- Molecular Structures

Types of Data (cont.)

- **Ordered**

- Video data: sequence of images
- Temporal data: time-series
- Sequential Data: transaction sequences
- Genetic sequence data

- **Spatial, image and multimedia**

- Spatial data: maps
- Image data
- Video data

Data Sets

Concept 2

- **Data sets** are made up of data objects.
- **A data object** represents an **entity** (also called **samples**, examples, instances, data points, objects, tuples).
- Data objects are described by **attributes**.

Attributes

Concept 3

An attribute (also called dimension, feature, variable) is a data field, representing a characteristic or feature of a data object.

Data set	Attributes
Sales database	customers, store items, sales
Medical database	patients, treatments
University database	students, professors, courses

Attribute Types

- **Nominal:** categories, states, or “names of things”
 - hair color = {auburn, black, blond, brown, grey, red, white}
 - marital status, occupation, ID numbers, zip codes
- **Binary:** nominal attribute with only two states
 - gender (symmetric: both outcomes equally important)
 - medical test (positive vs. negative) (asymmetric: outcomes not equally important)
- **Ordinal:** values have a meaningful order but magnitude between successive values is not known.
 - size = {small, medium, large}
 - grades, rankings

Numeric Attribute Types

Machine Learning

Machine Learning

Interpretable Machine Learning

Learning Agent

Data

Exploration

Type of Learnings

Successes of Machine Learning

Vision

Language

Games

Robotics

Other

- Quantity (integer or real-valued)
- **Interval scale:** Measured on a scale of equal-sized units. No true zero-point.
Values have order
 - temperature in Celsius or Fahrenheit
 - calendar dates
- **Ratio scale:** Inherent zero-point
 - temperature in Kelvin
 - length
 - counts
 - monetary quantities

Discrete vs. Continuous Attributes

Machine Learning

Machine Learning

Interpretable Machine Learning

Learning Agent

Data

Exploration

Type of Learnings

Successes of Machine Learning

Vision

Language

Games

Robotics

Other

- **Discrete Attribute:** Has only a finite or countably infinite set of values

- zip codes
- profession

Note: Sometimes, represented as integer variables; binary attributes are a special case of discrete attributes

- **Continuous Attribute:** Has real numbers as attribute values

- temperature
- height, or weight

Sample datasets

- Housing data for 506 census tracts of Boston from the 1970 census

Concept 4

A **tensor** is a generalized matrix, a finite table of numerical values indexed along several discrete dimensions.

- A 0d tensor is a scalar
- A 1d tensor is a vector (e.g. a sound sample)
- A 2d tensor is a matrix (e.g. a grayscale image)
- A 3d tensor (e.g. a multi-channel image)
- A 4d tensor (e.g. a sequence of multi-channel images)

Exploration

Data Visualization

Concept 5

Visualization is the conversion of data into a **visual** or **tabular format** so that the characteristics of the data and the relationships among data items or attributes can be analyzed or reported.

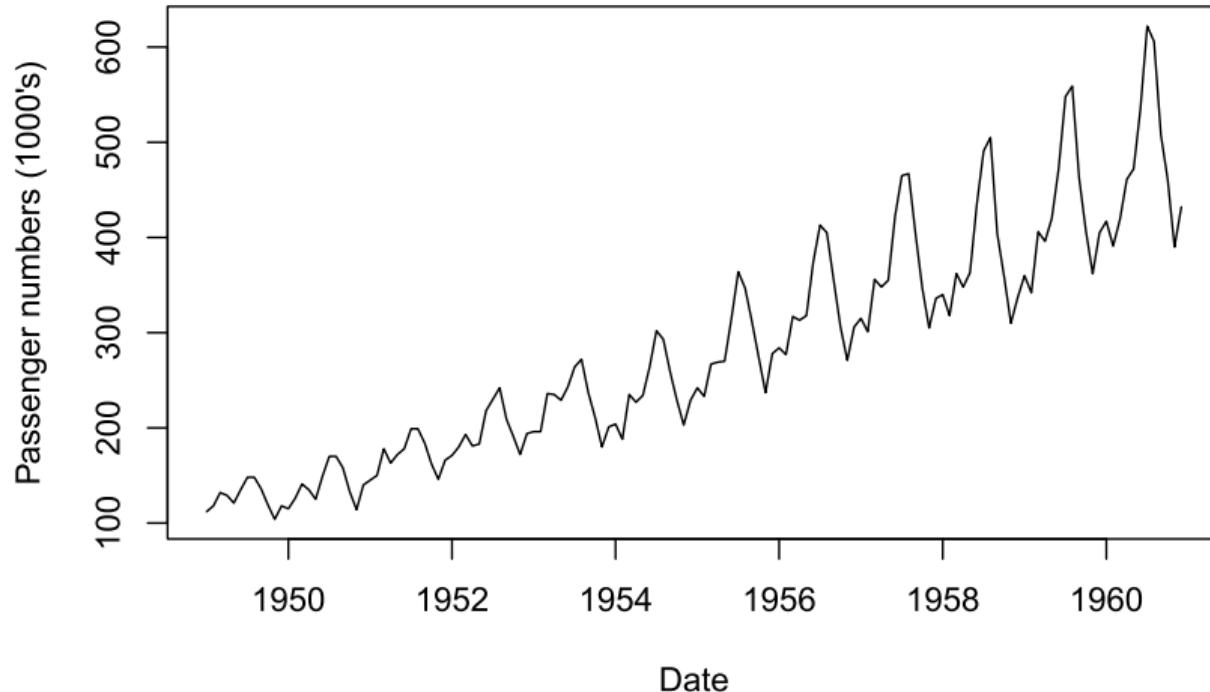

Humans have a well developed ability to analyze large amounts of information that is presented visually

- Can detect general patterns and trends
- Can detect outliers and unusual patterns

Translation

- “The reason Boeing are doing this is to cram more seats in to make their plane more competitive with our products,” said Kevin Keniston, head of passenger comfort at Europe’s Airbus.

- Kevin Keniston, người đứng đầu bộ phận thoải mái của hành khách tại Europe’s Airbus, cho biết: “Lý do Boeing làm điều này là để nhồi nhét thêm ghế để máy bay của họ cạnh tranh hơn với các sản phẩm của chúng tôi.”

Text Generation

- Language model: GPT3

MIT Technology Review

Artificial intelligence / Machine learning

OpenAI's new language generator GPT-3 is shockingly good—and completely mindless

The AI is the largest language model ever created and can generate amazing human-like text on demand but won't bring us closer to true intelligence.

MIT Technology Review

Opinion

GPT-3, Bloviator: OpenAI's language generator has no idea what it's talking about

Tests show that the popular AI still has a poor grasp of reality.

ChatGPT: Optimizing Language Models for Dialogue

We've trained a model called ChatGPT which interacts in a conversational way. The dialogue format makes it possible for ChatGPT to answer followup questions, admit its mistakes, challenge incorrect premises, and reject inappropriate requests. ChatGPT is a sibling model to InstructGPT, which is trained to follow an instruction in a prompt and provide a detailed response.
